1.1 Question 2

F: For 2D, modeling Any's high scores for Llama movies, we see that the result has flipped. Llama movies tend to be higher in the first attribute and lower in the second attribute. And Amy's weight is thus much higher for the first attribute compared to the second.

For 2E, modeling Dana's low rating for all movies, this has not changed at all. Despite the different U and V, UV^T is unchanged.
